

ZXQ-9000 Precision Quad Operational Amplifier

The ZXQ-9000 is a 14-pin quad op-amp in a PDIP package.

It offers four independent amplifiers with low offset voltage.

Supply pins V+ and V- accept a dual supply. Each amplifier has an inverting input, a non-inverting input, and an output. Typical applications include active filters and signal conditioning.

The device is pinned out in the standard quad op-amp configuration.

Absolute maximum ratings, electrical characteristics, and package dimensions are described in later sections. NC pins must be left open.
